Basic Process Overview

> **IMPORTANT:** All information contained in this website, including links to any additional documents, is shared with yc is solely for the purpose of daily integration and operation with our platform. All content herein is continuously bein therefore subject to change without prior notice. Some content is restricted to authorized personnel with access to credentials cannot be shared with anyone.

The basic process to integrate to **99Food** is shown as follows:

Phase 1: Pre-Process and Partner's Account Creation

Step 1: First Contact and Business Negotiation

The first step to becoming a 99Food partner is to get in touch with our team and begin business negotiations. During understand your business and requirements. We will check whether you are a store partner or a POS provider, how ma operate, how many can be integrated into our platform, your average number of daily orders, and your integration pro

For more details and guidance to start the process, you can contact :

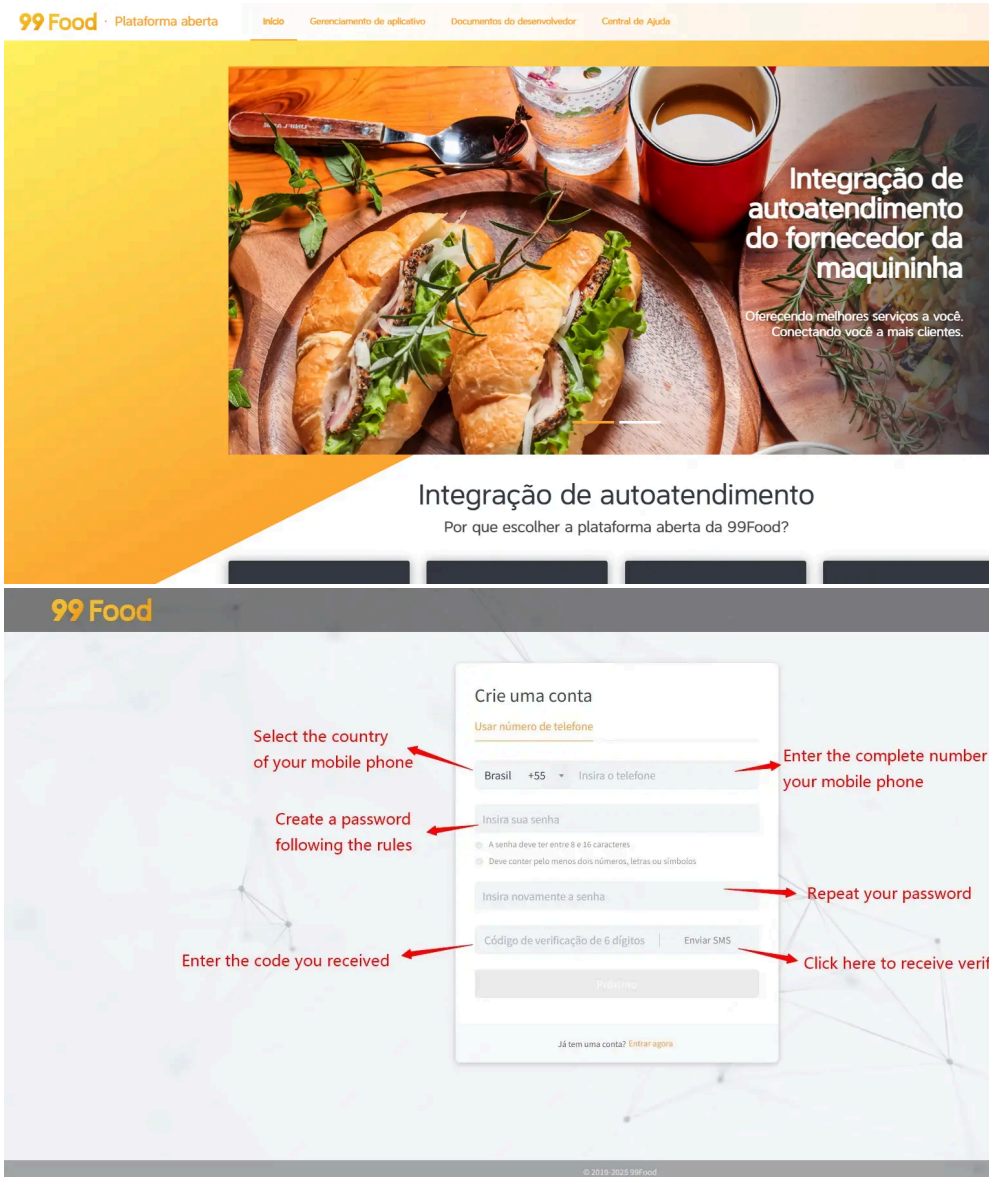

- 99Food's BDM (Business Development Manager)
- KAM (Key Account Manager)
- API integration team

Step 2: Signing of NDA

Before we can share any of our API information, an NDA must be signed. To proceed, we will request additional inform and send the NDA via DocuSign or another electronic method for your signature. The NDA must be signed by the com who has the Power of Attorney (POA) to enter into such agreements on behalf of the company.

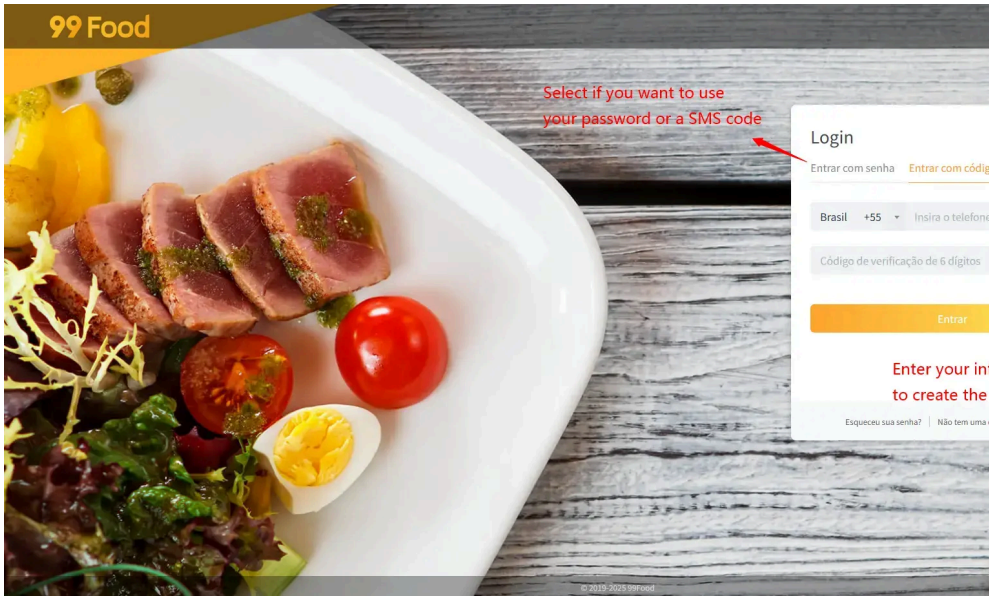

Step 3: Register and Create the Partner's Account

Once all relevant parties have signed the NDA, you will be able to register on our portal. When accessing the Portal fo to create your account.

After creating your account, you can sign in:

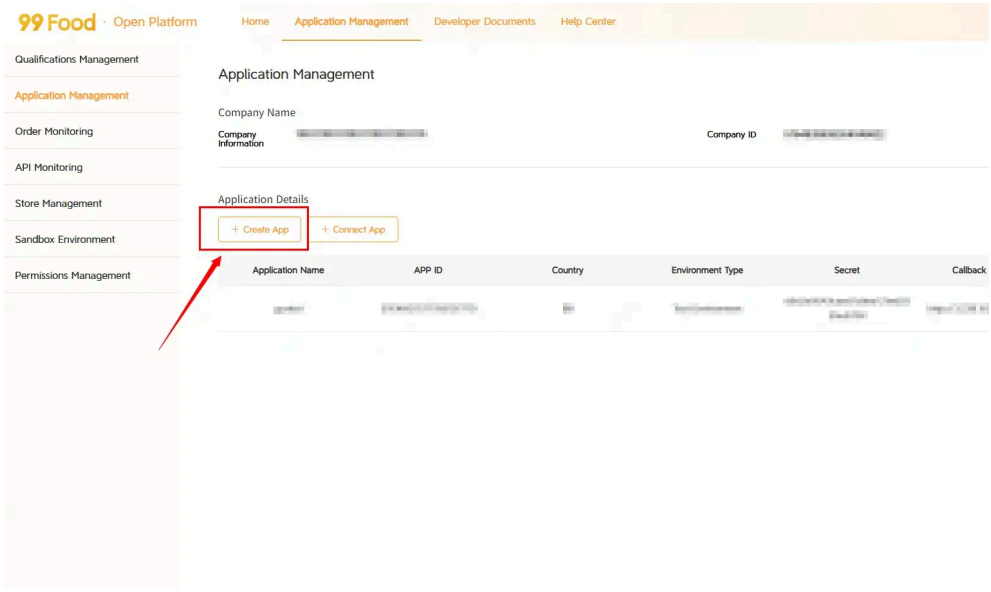

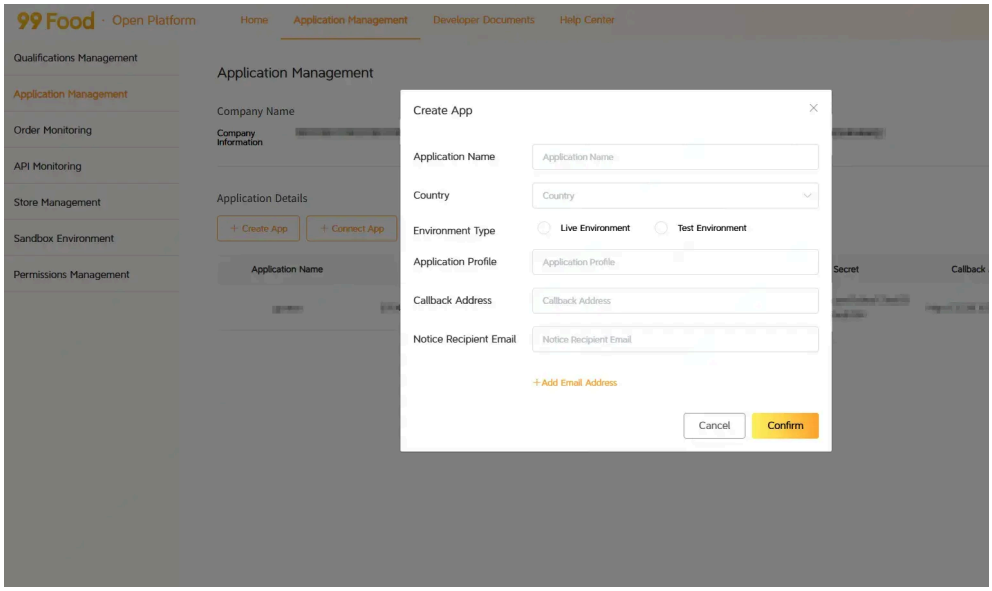

To access the full benefits of the platform, you'll need to provide detailed company information by completing the requ
your request will undergo an audit process. To learn how to complete this step, go to: **Tools Introduction > Qualificatior**

Phase 2: Development in Test Environment and Testing

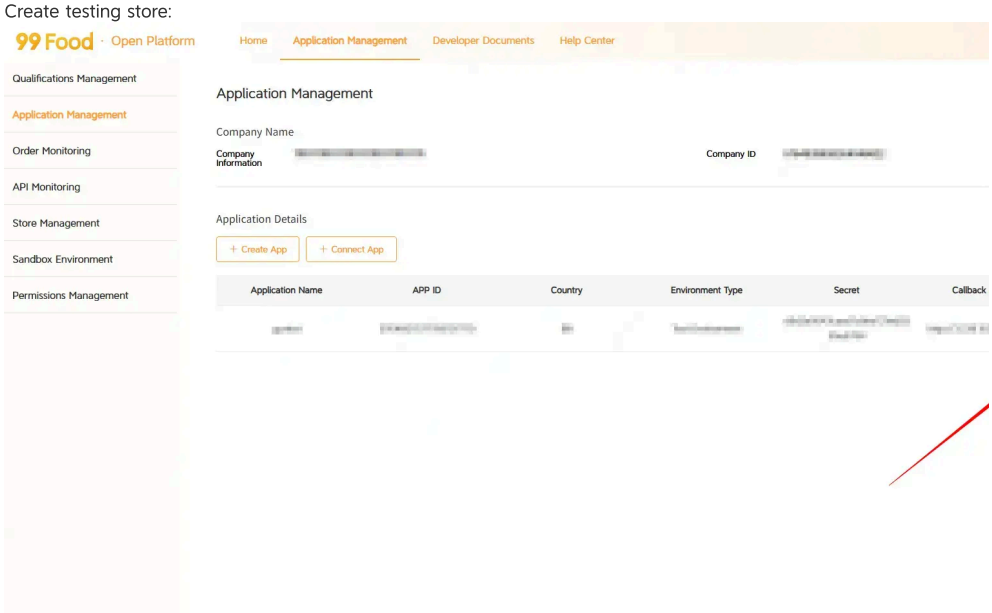

Steps 1 and 2: Create Testing Application and Create Testing Store

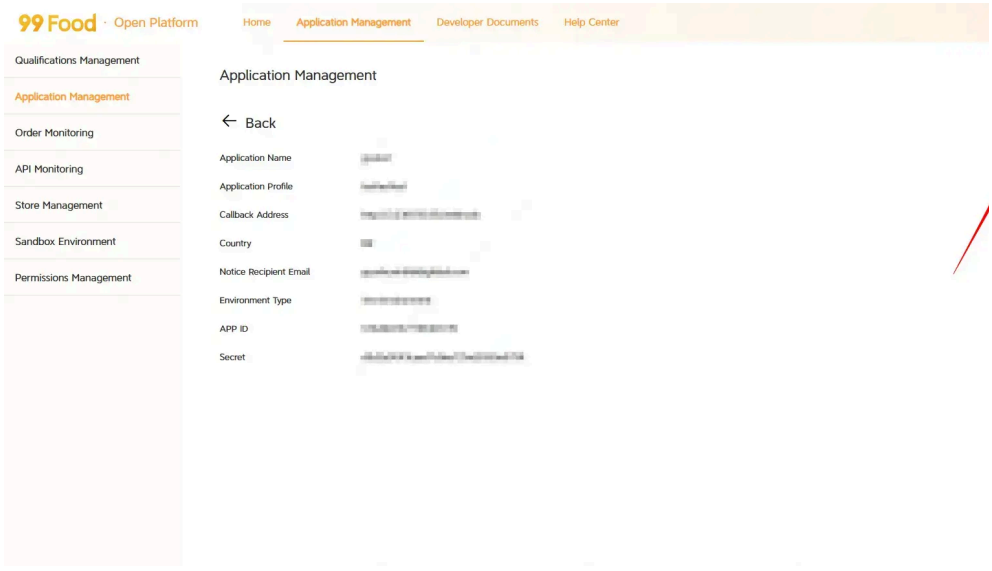

Once your qualification process has been approved, you will be able to create applications and test stores to begin the
independently. Create testing application:

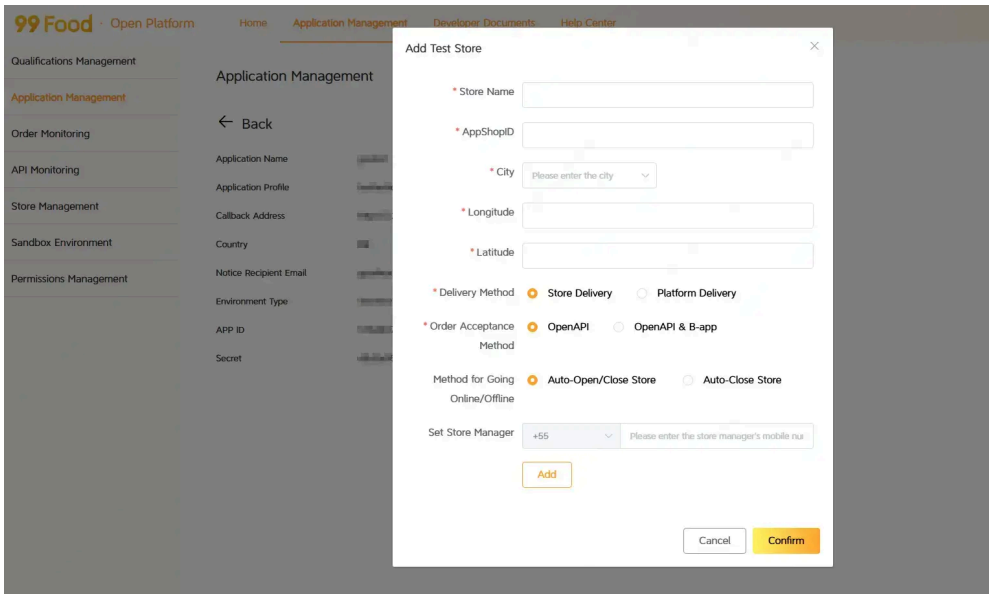

Create testing store:

Step 3: Developing and QA phase

Now it's time to **develop your integration and do some testing**! All information necessary to integrate using our API ca After reading the document carefully, we can set up a kickoff meeting with one of our specialists to explain some deta testing process. Talk to your KAM, BDM or API Integration Specialist you are in contact with for that.

We can also create a WhatsApp group for quick communication. This group shall consist of technical, product and con people from both sides as well as the team leaders for integration status update.

Check on the flowchart above some important check points when doing the QA. To test the stores, we have some imp

- **YAML file**: We provide you with a yaml file with our most recent OpenAPI Specification that you can u or Postman to test our API. Read more in **Testing and Debugging > API Reference**.
- **Sandbox Environment**: We have a sandbox environment where you can test order callbacks and the r check whether the menu items are correctly injected into your system). Read more in **Tools Introducti Environment**.
- **User's Test Credentials**: We can create a client's test account so you can simulate creating orders in t test all the integrated endpoints and webhook callbacks. Learn how to do testing in **Testing and Debu Integration**.

> **ATTENTION**: We use long (64-bit integer) as IDs for app, orders and stores. So please pay attention when parsing t example, in Node.js our order_id 5764607801871631353 will be parsed as 5764607801871631000 with lib "body-pa Please use json-bigint to parse it: var jsonBig = require('json-bigint'); jsonBig.parse(data).

Phase 3: Pilot Phase

Step 1: Create Production Application

After completing all development and QA activities—and confirming that all requirements outlined in **Integration Guide** been met—you can create the **Production Application**, where real stores will be added to operate using y tegratio **Tools Introduction > Application Management** to complete this step.

Step 2: Add Pilot Store to Application

We recommend starting with a **pilot phase** by adding one or two stores to the production application. Thi ows you t ordering process work correctly in the live environment.

Steps 3 and 4: Monitor Performance and Operation and Check for Errors, Correct and Re-test

Once the pilot stores are live, it's time to monitor their operational performance. Check for any errors, correct them, ar
Helpful tools for these steps can be found in:

- **Tools Introduction > Order Monitoring**
- **Tools Introduction > API Monitoring**

Phase 4: Expansion and Monitoring

Step 1: Add New Stores to the Application

After confirming everything is working and the system is stable, is time to add more stores to your application. For this
options:

> **NOTE:** Each store can only be bound to one production app.

1. Self-service mode (Recommended): You can add new stores by yourself, using two different processes:

1. **Add new stores one by one:** To do so, you can send a request to a store, asking them to bind to your
to use this feature in **Authorization API > Get Authorization Web Page**), or you can use our binding e
Bind/Unbind Store).
2. **Batch add stores:** You can add stores in batches using our application tool. Learn more in **Tools Introc
Management**.

2. 99Food's assisted mode: You can also ask our team to add a store to your application. To do so, send an e-mail to t
contact with, telling that you want to bind (or unbind) a store, adding the country of your application, the app_id and t
corresponding app_shop_id of each store. Our Integration Ops Team will integrate the store(s) and let you know when

Step 2: Monitor the Application

We provide multiple types of statistical data such as applications, stores, orders and interfaces, that our partners can cl
online faults can be found through data monitoring.

For stores that have already been bound, partners can use the **Open Platform Application Management** to:

- change the store's order acceptance method,
- manage how stores go online and offline, and
- unbind stores if needed. You can learn more in the **Tools Introduction** section.
